Problem Tracker — Segment 1: The Problem

1 of 8 · 3 min

Opening of a 40-minute technical deep dive · "walk us through it — architecture, your involvement, outcomes"

> **Say this first:** "I built a spaced-repetition tracker for coding-interview problems — like Anki, but scheduling LeetCode and NeetCode problems instead of flashcards. I built it because neither platform actually does this, and it turned into a genuinely deep systems project once I started reconciling two sources of truth into one."

The 3-Minute Run of Show

0:00–1:00	The gap in existing tools
1:00–2:00	Why build instead of use something existing
2:00–3:00	Scope, then straight into the live demo

If They Only Remember One Thing

- This isn't "I used a tool" — it's "I own the data across two platforms neither of which talks to the other, and I built the scheduling logic myself because a generic tool couldn't."

Section-by-Section Script

The gap in existing tools (0:00–1:00)

- *"NeetCode tracks completion with a checkbox — solve it once, it's marked done forever. There's no signal to ever revisit it, no sense of 'you solved this three months ago, you're due for a refresher.' Spaced repetition is well-established for memory retention — that's the entire premise of Anki — but nobody applies it to interview-prep problems specifically."*
- *"And LeetCode's free tier has no real category/pattern system at all — its own solved list has zero visibility into NeetCode's curriculum, or vice versa. Solve something directly on leetcode.com and NeetCode never finds out."*

Why build instead of use something existing (1:00–2:00)

- *"I considered a spreadsheet — no scheduling logic, all manual. Anki itself — flashcards aren't code problems, and it has no concept of a category-balanced daily queue. NeetCode Pro's own tracking — single source, blind to anything solved on LeetCode directly."*
- *"Building it myself buys three things: I own the data in one SQLite file instead of being locked into a platform's UI, I get a scheduling heuristic tuned to my actual weak patterns instead of a generic 'due date,' and I get one true picture of 'have I actually solved this' across both platforms."*

Scope, then into the demo (2:00–3:00)

- *"Right now it's tracking 354 problems across both platforms — spanning the curated 150-problem NeetCode curriculum and problems I've solved entirely outside it. That reconciliation between two sources ends up being one of the more interesting parts of the system, and I'll come back to it."*
- *"That's the why. Let me show you the actual thing running."* — switch to the live app.
