Problem Tracker — Segment 7: Where This Goes Next

7 of 8 · 5 min

Outcomes so far, and a roadmap with a trigger condition attached to every item, not a wish list

Opening line: "Every item on this roadmap came from a real gap I hit building the current features — and just as importantly, I tried one of these ideas already and reverted it, which is its own useful outcome."

Shipped

- Recommendation engine (catalog table, gap + weak-pattern suggestions)
- Overdue-tab scale fix, Streamlit-version compatibility guard
- Difficulty / category / accepted-date backfills across both platforms
- Daily email digest — 2 review + 1 new pick, scheduled via launchd

Tried, then reverted

- Widened the NeetCode scrape to the full ~973-problem catalog
- Real issues: pagination complexity, much slower runtime, a URL-identity bug
- Reverted to the 150-list; root cause fixed so it's revisitable more carefully

Next (with a trigger condition)

- Difficulty-gate recommendations by my own solve latency, not NeetCode's static label
- Multi-user split, once/if this ever needs more than one user
- Revisit SM-2 once review history is old and dense enough — checkable, not a guess

The 5-Minute Run of Show

0:00–0:20	Opening line (above)
0:20–1:30	What actually shipped, briefly
1:30–2:45	The one I tried and reverted — and why that's a good outcome
2:45–4:00	What's next, with real trigger conditions
4:00–5:00	The honest "not doing" list + close

If They Only Remember One Thing

- Every future item has a concrete trigger condition — "once X happens, do Y" — including the one thing I already tried and walked back, which is a stronger signal of judgment than a clean success streak.

Section-by-Section Script

The revert, and why it's a good outcome (1:30–2:45)

- *"I widened the catalog scrape to NeetCode's full list to grow the recommendation pool 6x. It actually worked, mostly — but the runtime got much longer, the site paginates within a category in a way the smaller list never needed, and switching back and forth between the two scrape targets introduced a real duplicate-data bug. None of that was worth it yet for a feature that already works fine at 150 problems."*
- *"Reverting wasn't giving up — I fixed the root cause of the bug it exposed either way, so the option is cheaper to revisit later than it was to attempt blind the first time."*

What's next, with trigger conditions (2:45–4:00)

- *"Difficulty-gating recommendations off my own solve latency instead of NeetCode's static label — a narrow extension of code that already exists."*
- *"SM-2 specifically: I'm not adopting it speculatively. The trigger is checkable by rerunning sm2_vs_heuristic_demo.py against future data, not a feeling."*

The "not doing" list + close (4:00–5:00)

- *"I'm deliberately not building a mobile app or social features — neither addresses a gap I've actually hit using this myself."*
- Invite questions.
